

# TypeScript

Intro and all you need to know before starting with  
TypeScript

# Agenda

- What is TypeScript?
- Why TypeScript?
- Some basics
- Task

# Agenda

- What is TypeScript?
- Why TypeScript?
- Some examples and a bit about types
- Task

Check if you have node, npm and tsc ready:

- `node -v`
- `npm -v`
- `tsc -v`

## What is TypeScript?

TypeScript is **JavaScript**  
**with syntax for types.**

TypeScript is a strongly typed programming language that builds on JavaScript, giving you better tooling at any scale.

<https://www.typescriptlang.org/>

# What is TypeScript?

## JavaScript

Primitive Types

Control Structures

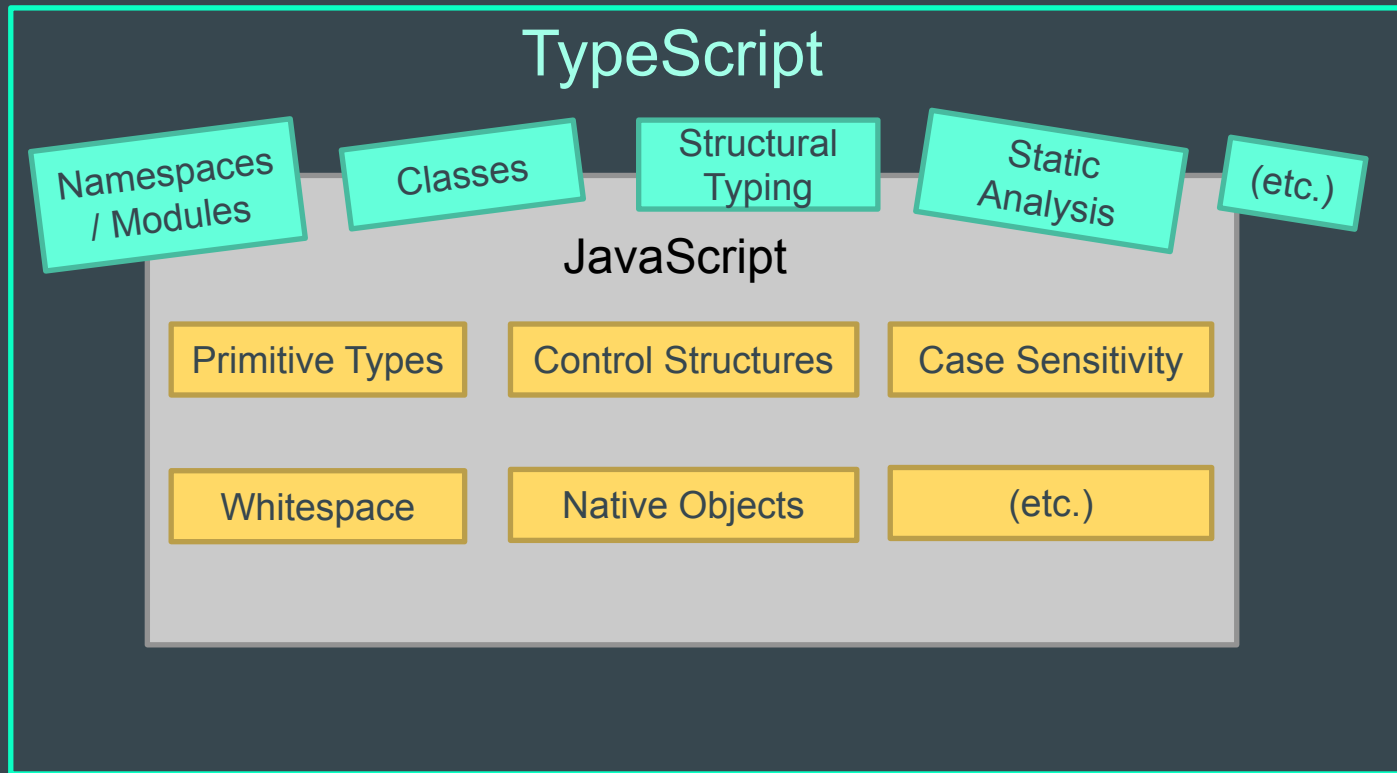

Case Sensitivity

Whitespace

Native Objects

(etc.)

# What is TypeScript?

Can I find a specific data type for a variable in JavaScript ?

How do I organise my code into classes or modules or namespaces ?

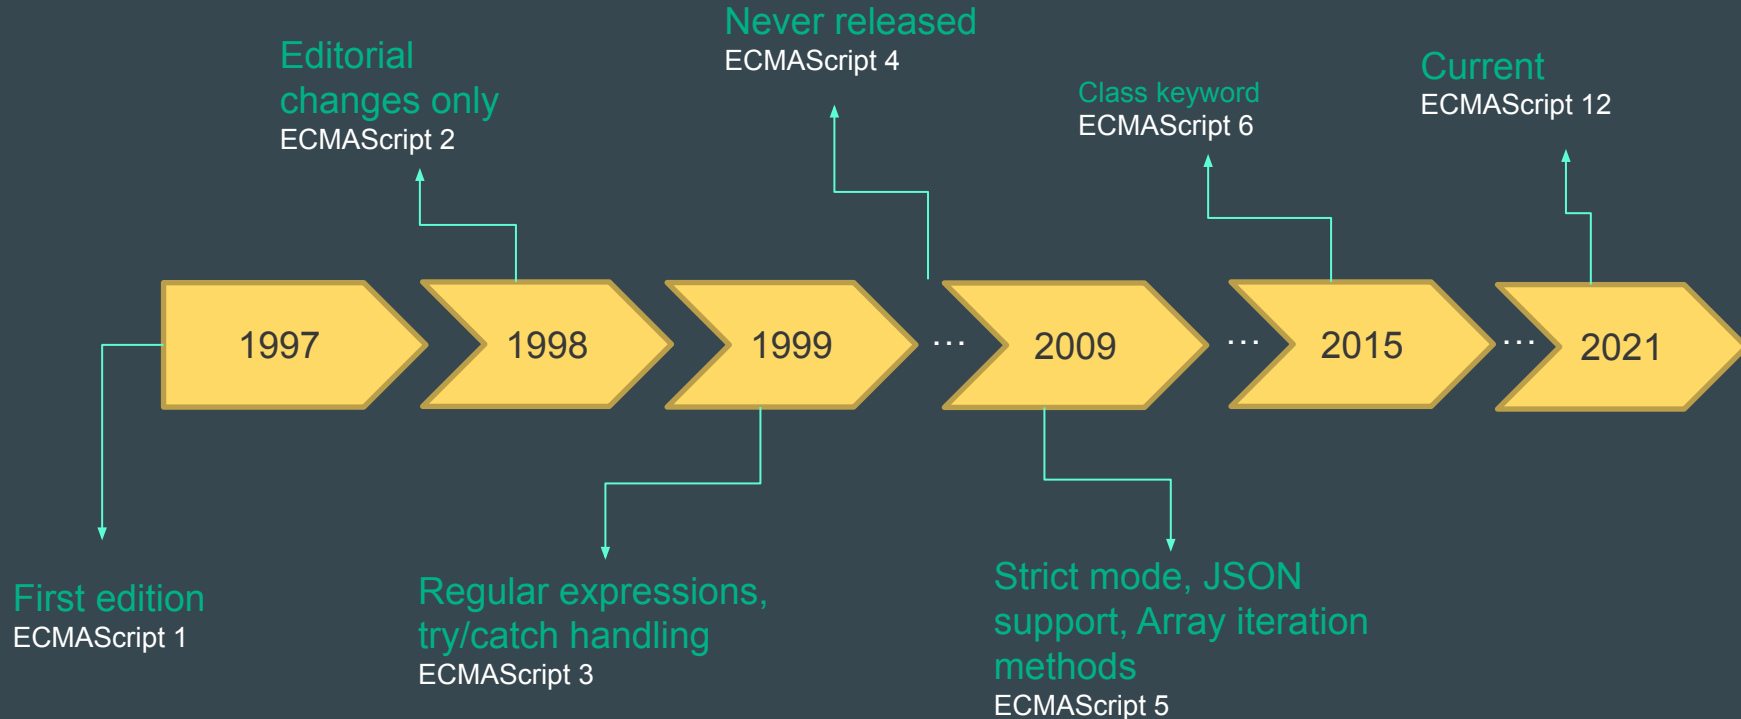

If I'm dealing with multiple files is there a way that JS code from one file can figure out what's in another JS code file ?

I must have some really cool debugging tools then?

Eh...

ECMAScript is a JavaScript standard meant to ensure the interoperability of web pages across different web browsers. It is standardized by Ecma International according to the document ECMA-262. - *Wikipedia*

# What is TypeScript?

TypeScript  
Source Code

Compilation  
(transpiling)

JavaScript  
Source Code

...

# Why TypeScript?

# Why TypeScript?

Static types (variables, parameters, return types etc.)

JS

```
1 // Variable in JavaScript
2
3 var myVariable = "Hi, there!";
4
5 // Later in the code...
6
7 myVariable = 12345;
8
9 // Sometime later ...
10
11 myVariable = [1, 2, 3, 4, 5];
12
13 // or...
14
15 myVariable = function() {
16     console.log("Hi, there!");
17 }
18 myVariable();
19
20 // and yet...
21
22 myVariable = null;
```

# Why TypeScript?

Static types (variables, parameters, return types etc.)

JS

```
1 // Variable in JavaScript
2
3 var myVariable = "Hi, there!";
4
5 // Later in the code...
6
7 myVariable = 12345;
8
9 // Sometime later ...
10
11 myVariable = [1, 2, 3, 4, 5];
12
13 // or...
14
15 myVariable = function() {
16     console.log("Hi, there!");
17 }
18 myVariable();
19
20 // and yet...
21
22 myVariable = null;
```

```
1 // Variable in JavaScript
2
3 var myVariable = "Hi, there!";
4
5 // Later in the code...
6
7 myVariable = 12345;
8
9 // Sometime later ...
```

```
11 var myVariable: string
```

```
12 Type '() => void' is not assignable to type 'string'. (2322)
```

```
13 View Problem (⌘F8) Quick Fix... (⌘.)
```

```
15 myVariable = function() {
16     console.log("Hi, there!");
17 }
18 myVariable();
19
20 // and yet...
21
22 myVariable = null;
23
```

# Why TypeScript?

Organizational support (making it easier to manage a large codebase)

## Classes

```
1 class Point {  
2   x: number;  
3   y: number;  
4 }  
5  
6 const pt = new Point();  
7 pt.x = 0;  
8 pt.y = 0;
```

## Namespaces / Modules

```
// @filename: hello.ts  
export default function helloWorld() {  
  console.log("Hello, world!");  
}
```

This is then imported via:

```
import helloWorld from "./hello.js";  
helloWorld();
```

```
namespace Validation {  
  export interface StringValidator {  
    isAcceptable(s: string): boolean;  
  }  
}
```

(etc.)

## Interfaces

```
interface StringValidator {  
  isAcceptable(s: string): boolean;  
}
```

## Why TypeScript?

Organizational support (making it easier to manage a large codebase)

```
interface StringValidator {  
    isAcceptable(s: string): boolean;  
}  
  
let lettersRegex = /^[A-Za-z]+$/;  
let numberRegex = /^[0-9]+$/;  
  
class LettersOnlyValidator implements StringValidator {  
    isAcceptable(s: string) {  
        return lettersRegex.test(s);  
    }  
}  
  
class ZipCodeValidator implements StringValidator {  
    isAcceptable(s: string) {  
        return s.length === 5 && numberRegex.test(s);  
    }  
}
```

# Why TypeScript?

Tooling support (static type analysis, instant errors)

```
function sayHi(name: string): string {  
    return `Hi, ${name}!`;  
    alert("Hi ${name}!");  
}
```

Unreachable code detected. (7027)

[View Problem \(⌘F8\)](#) [Quick Fix... \(⌘.\)](#)

```
let surname: string  
'surname' is declared but its value is never read. (6133)  
Quick Fix... (⌘.)  
let surname = "Pavardenis";  
return `Hi, ${name}!`;  
}
```

Some examples...

## Basics

Static types (variables, parameters, return types etc.)

✗ **Don't** use **any** as a type unless you are in the process of migrating a JavaScript project to TypeScript. The compiler *effectively* treats any as “please turn off type checking for this thing”

If type is not supplied when declaring variable, it will be type “any” by default.

```
let phoneNumber;  
  
let phoneNumber: any;  
phoneNumber = '88888';
```

<https://www.typescriptlang.org/docs/handbook/declaration-files/do-s-and-don-ts.html>

# Why TypeScript?

Static types (variables, parameters, return types etc.)

## General Types

`Number`, `String`, `Boolean`, `Symbol` and `Object`

❌ **Don't** ever use the types `Number`, `String`, `Boolean`, `Symbol`, or `Object`. These types refer to non-primitive boxed objects that are almost never used appropriately in JavaScript code.

```
/* WRONG */  
function reverse(s: String): String;
```

✅ **Do** use the types `number`, `string`, `boolean`, and `symbol`.

```
/* OK */  
function reverse(s: string): string;
```

<https://www.typescriptlang.org/docs/handbook/declaration-files/do-s-and-don-ts.html>

# Why TypeScript?

Static types (variables, parameters, return types etc.)

# Helper

- ❑ Install TypeScript using a command (`npm install -g typescript`) you can also use documentation instructions (<https://www.typescriptlang.org/download> )
- ❑ Create a `.ts` file in your editor (any name you like)
- ❑ run `tsc your_file_name.ts`
- ❑ Check the code in the `your_file_name.js`

# Task

Time: 10 minutes

- ❑ Create a file `.ts` (any name you like) containing a class with some properties and a constructor.
- ❑ Create a `tsconfig.json` file and configure the output directory to be `my_fav_dir` (or any name you like). Meaning that your generated `.js` file needs to end up in your output dir.
- ❑ Build your `.ts` file to get `.js` file.

Bonus point:

- ❖ One class property is of some your created type;
- ❖ Configure compiler to build `.js` file in es3 version.

Helper

Documentation is your friend: <https://www.typescriptlang.org/>

To install TypeScript use a command `npm install -g typescript` (g option will install it globally) or if you prefer some more options can be found:

<https://www.typescriptlang.org/download>

For those struggling to install (I suggest to use the playground

<https://www.typescriptlang.org/play>)

For those who don't have a node please follow the instructions here:

<https://docs.npmjs.com/downloading-and-installing-node-js-and-npm>

And Enjoy!
